## CHAPTER IV

## FINDING AND DISCUSSION

This chapter the writer present about The Description of Data, Hypothesis Testing, and Discussion.

## A. The Description of Data

In this chapter, it will be discussed and explained about the score of Intelligence Quotient and the result of students' English Achievement which have been collected. To find out whether there is significance correlation between Intelligence Quotient (IQ) and Students’ English Achievement.

1. Data of Students' Intelligence Quotient

From the table, it can be seen the total score from 29 respondents is 3339 . the minimum score is 94 , Maximum score is 133 , mean is 115.13 , median is 115 , mode is 121.

In this case, students' IQ score is as independent variable (X). the IQ score of X science 1 students that held by Pusat Layanan Psikologi Univesitas Muhammadiyah Malang on February $24^{\text {th }}$ 2013, as follows:

Table 4.1
The score of Students' IQ

| N | Name | Score of Students' IQ (X) |
| :---: | :---: | :---: |
| 1 | AR | 107 |
| 2 | AM | 97 |
| 3 | AAL | 121 |

## 2. Data of Students' Achievement

From the table, it can be seen the total score from 29 respondents is 2348 , the minimum score is 70 , Maximum score is 90 , mean is 80.96 , median is 82 , mode is 86 .

In this case, students' achievement is as dependent variable $(\mathrm{Y})$. the writer took the students' English score from the result of students' test. The data is described on the following table:

Table 4.2
The score of Students' Achievement

| $\mathbf{N}$ | Name | score of Students' Achievement (Y) |
| :---: | :---: | :---: |
| $\mathbf{1}$ | AR | 80 |

3. The Correlation Between Intelligence Quotient and Students Achievement

After achieving the data of the IQ score as variable X and score of English learning achievement as variable Y , the next step is determine the calculation table, which is to be used as the calculation for the index score correlation of product moment.

In this case, both of students' IQ score and English score are correlated by using Person's Product Moment formula. The data describe on the following table:

Table 4.3
Coefficient Correlation Variable $\mathbf{X}$ and Variable $\mathbf{Y}$

| $\mathbf{N}$ | $\mathbf{X}$ | $\mathbf{Y}$ | $\mathbf{X . Y}$ | $\mathbf{X 2}$ | $\mathbf{Y 2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 107 | 80 | 8560 | 11449 | 6400 |
| 2 | 97 | 70 | 6790 | 9409 | 4900 |

| 14 | 129 | 84 | 10836 | 16641 | 7056 |
| 15 | 133 | 90 | 11970 | 17689 | 8100 |
| 16 | 113 | 84 | 9492 | 12769 | 7056 |
| 17 | 120 | 86 | 10320 | 14400 | 7396 |
| 18 | 121 | 82 | 9922 | 14641 | 6724 |
| 19 | 113 | 80 | 9040 | 12769 | 6400 |
| 20 | 110 | 78 | 8580 | 12100 | 6084 |
| 21 | 94 | 74 | 6956 | 8836 | 5476 |
| 22 | 115 | 86 | 9890 | 13225 | 7396 |
| 23 | 126 | 86 | 10836 | 15876 | 7396 |
| 24 | 117 | 76 | 8892 | 13689 | 5776 |
| 25 | 114 | 84 | 9576 | 12996 | 7056 |
| 26 | 119 | 78 | 9282 | 14161 | 6084 |
| 27 | 131 | 87 | 11397 | 17161 | 7569 |
| 28 | 115 | 80 | 9200 | 13225 | 6400 |
| 29 | 96 | 76 | 7296 | 9216 | 5776 |
|  | $\sum \mathbf{3 3 3 9}$ | $\sum \mathbf{2 3 4 8}$ | $\sum \mathbf{2 7 1 5 8 0}$ | $\sum \mathbf{3 8 7 5 8 7}$ | $\sum \mathbf{1 9 0 9 1 0}$ |

After calculation of the whole data from variable X and variable Y , the next step is to insert the data from the table into the Pearson's product moment formula to find the correlation index as follow:

$$
\begin{aligned}
& r_{\mathrm{xy}}=\frac{\mathrm{N}_{\Sigma \mathrm{XY}-\left(\sum \mathrm{X}\right)\left(\sum \mathrm{Y}\right)}^{\sqrt{\left\{\mathrm{N} \sum \mathrm{X}^{2}-\left(\sum \mathrm{X}\right)^{2}\right\}\left\{\mathrm{N} \sum \mathrm{Y}^{2}-\left(\sum \mathrm{Y}\right)^{2}\right\}}}}{\mathrm{r}_{\mathrm{xy}}=\frac{29 \times 271580-(3339)(2348)}{\sqrt{\left\{29 \times 387587-(3339)^{2}\right\}\left\{29 \times 1909910-(2348)^{2}\right\}}}} \\
& \mathrm{r}_{\mathrm{xy}}=\frac{7875820-7839972}{\sqrt{\{11240023-11148921\}\{5536390-5513104\}}} \\
& \mathrm{r}_{\mathrm{xy}}=\frac{35848}{\sqrt{\{91102 \times 23286\}}} \\
& \mathrm{r}_{\mathrm{xy}}=\frac{35848}{\sqrt{2121401172}} \\
& \mathrm{r}_{\mathrm{xy}}=\frac{35848}{46058,67} \\
& \mathrm{r}_{\mathrm{xy}}=0,778
\end{aligned}
$$

The last step is determining Degree of freedom ( $\mathrm{d} f$ )
$\mathrm{df}=\mathrm{N}-1=29-1=28$
$\mathrm{df}=28$ (see table of "r" values of degree of significance $5 \%$ and $1 \%$ )

At the degree of significance $5 \%=0,361$

At the degree of significance $1 \%=0,463$
$5 \%=$ ro $: r t=0,778: 0,361$
$1 \%=\mathrm{ro}: \mathrm{rt}=0,778: 0,463$

Table 4.4
Interpretation of " $r$ " Value Correlation Product Moment Person for Variety of $\mathbf{d} f$

| 1000 | 0.062 | 0.021 |

After the writer proceeded the formula, as it had been found out about the result of correlation, the next step is to give the interpretation of " $r$ " score $\left(r_{x y}\right)$.

1. From the data of students' IQ score and their English score, it appeared that the correlation index between variable X and variable Y is 0,778 . It means there is positive correlation between two variables. To give simple interpretation toward the correlation index " r " Product moment $\left(\mathrm{r}_{\mathrm{xy}}\right)$ can be done by following table:

Table 4.5 Interpretation of Product Moment Score

| "r" Score of Product <br> Moment $\left(\mathrm{r}_{\mathrm{xy}}\right)$ | Interpretation |
| :---: | :--- |
| $0.0-0.20$ | There is no correlation (Very low) |
| $0.20-0.40$ | There is low correlation (Low) |
| $0.40-0.70$ | There is medium correlation (Enough) |
| $0.70-0.90$ | There is strong correlation (High) |
| $0.90-1.00$ | There is very strong correlation (Very strong) |

Looking at the score $\mathrm{r}_{\mathrm{xy}}=0.778$ that the score approximately between $0.70-0.90$ is strong correlation or high correlation or it means there is significance correlation between variable X and variable Y .
2. The writer used interpretation with table of value " r " : $\mathrm{d} f=\mathrm{N}-1=29-1$ $=28$. Looking at the table of significance of $5 \%$ in $\mathrm{r}_{\text {table }}=0.361$, and $1 \%=$ 0.463 because $\mathrm{r}_{\mathrm{xy}}$ on the table of significance of $5 \%$ is bigger than $\mathrm{r}_{\text {table }}$ $(0.778>0.361)$, so on the table degree of significance of $5 \%$ the null hypothesis (Ho) is rejected but the alternative hypothesis (Ha) is accepted. So, it means on the degree of significance $5 \%$ there is a significance correlation between variable X and variable Y . Then, because on the degree of significance $1 \% \mathrm{r}_{\mathrm{xy}}$ is bigger than $\mathrm{r}_{\text {table }}(0.778>$ 0.463 ) so on the degree of significance $1 \%$ the null hypothesis (Ho) is
rejected but the alternative hypothesis (Ha) is accepted. So, it means on the degree of significance $1 \%$ there is a significance correlation between variable X and variable Y .

From the calculation of estimation above, it concludes that there is strong correlation between students' Intelligence Quotient and their achievement in learning English, and hypothesis of the research is accepted. It means that between both variables is correlations.

## B. Hypothesis Testing

To prove the result of hypothesis, the writer calculates the obtained data by using Pearson's coefficient of correlation or "Product Moment" as follow:

1. Formulation the alternative hypothesis (Ha): There is a significant correlation between variable X and variable Y .
2. Formulation the null hypothesis (Ho): There is not a significant correlation between variable X and variable Y .

From the formulation above, the writer followed some assumption as below:

1. If the result of calculation $r_{o}$ is lower than $r_{t}(r$ table $) r_{o}<r_{t}$, the null hypothesis $(\mathrm{Ho})$ is accepted, and alternative hypothesis $(\mathrm{Ha})$ is rejected.
2. If the result of calculation $r_{o}$ is bigger than $r_{t}(r$ table $) r_{o}>r_{t},(0.778>0.361<$ 0.463 ) the null hypothesis $(\mathrm{Ho})$ is rejected, and alternative hypothesis $(\mathrm{Ha})$ is accepted.

Based on description of calculation above, the result of this research is $r_{o}$ is bigger than $r_{t}(r$ table $) r_{o}>r_{t}(0.778>0.361<0.463)$, the null hypothesis $(H o)$ is rejected, and alternative hypothesis (Ha) is accepted.

## C. Discussion

This study is conducted to find out the correlation between Intelligence Quotient (IQ) score and English achievement. As stated in a book by Slameti (56:2003) in a same situation the students has a high level of intelligence could be more successful than the students has a low level of intelligence. Eventhough the student was has a high level of intelligence not definitively success in their learning.

From the description above, it can conclude that the research could say the same from Slameti there is significance correlation between students' Intelligence Quotient and their achievement in learning English, where the intelligence quotient give contribution 0.778 from 1.00 score of interpretation of product moment. It means that the student who has high IQ score will get high score in English. Although not all of them get good score but the average of them will get good score.
