Dear Suyitno

Thank you for submitting your manuscript.

Manuscript ID will be send to you **within 3-5 weeks after editorial initial screening process** and that ID should be used in all future correspondence with the journal office and editors. Please do not hesitate to contact the journal office if you have any queries about your paper.

Once Again, Thank you for submitting your manuscript to **IRJMS**.

Sincerely,
IRJMS Editorial Office

Abstract

The research aims to determine the level of effectiveness of implementing the Guided Inquiry Learning (GIL) model in improving learning outcomes and the influence of the Guided Inquiry Learning model on student learning outcomes in Islamic Religious Education subjects. A number of previous studies have been carried out applying the GIL model in several subjects, however they have only looked at its effect on several aspects of competency, but not many have looked at its level of effectiveness. This research used a quasi-experimental design involving tenth grade students, academic year 2023/2024 as the population. Meanwhile, the sample was 71 students selected through multi-stage sampling. The data consisted of student test scores analyzed via one-way ANOVA. These findings confirm the conclusion that the application of the guided inquiry learning model is quite effective in improving student learning outcomes and the application of the guided inquiry learning model has a significant effect on student learning outcomes in Islamic Religious Education subjects.

Keywords: Guided Inquiry Learning Model, Conventional Learning Model, Student Learning Outcomes, Islamic Religious Education

Introduction

Learning competency is a multifaceted capability that students possess, encompassing the mastery of understanding, capabilities, attitudes, and values, which are apparent in their thoughts and actions (Hartig & Leutner in the study (1). One form of managing student diversity is by applying learning strategies that accommodate the learning needs of each student (2). In addition, learning using the current curriculum provides freedom for educators to design learning to suit students' learning needs (3). This is of course beneficial for students because differences in learning processes, intelligence and interests are not a problem for students but are unique things that can be used to complement each other(4). Therefore, educators are required to understand the learning approach that will be used, choose appropriate learning strategies, learning methods and techniques that are appropriate to the topic and discussion (5). This situation naturally influences its use in the pedagogical process, where the circumstances and conditions encountered will affect students' mastery and learning outcomes (6).

According to (7), the learning approach can be understood as our perspective or starting point in the learning process. It reflects a broad, general view of how the process occurs, serving to accommodate, inspire, reinforce, and underpin specific learning methods within a particular theoretical framework. In the study Roy Killen (8) states that there are two methods of learning: one that focuses on the teacher (teacher-centered) and another that centers on the student (student-centered). The former minimizes the use of direct learning strategies, deductive methods, or expository techniques (9), while the latter

maximizes the use of discovery, inquiry, and inductive learning strategies. Implementing the inquiry method is the right way for students.

According to (10), guided inquiry is a teaching approach aimed at helping students understand concepts and the connections between them. In this method, the teacher presents examples, assists students in identifying patterns within these examples, and concludes the lesson once the students can articulate the concepts taught. In addition, (11) stated that the guided inquiry learning is a form of inquiry-based instructions where the teacher guides students, helping them explore and analyze critical and scientifically argumentative topics through specific steps. These steps include orientation, formulating a problem, developing a hypothesis, and drawing conclusions (12). According to Kindsvatter in the study (13), directed inquiry refers to a type of inquiry where the teacher plays a significant role. Various models of Inquiry-Based Science Education (IBSE) have been created that focus on enhancing student engagement; one of which is the guided inquiry learning (GIL). The model encompasses critical thinking and reasoning, skill enhancement, scientific methods, and teamwork and collaboration. In the GIL, students work together and participate actively in discussions to identify the best solutions to the problems presented by their teacher (14). The design showcases a scientific checklist that cycles through various stages in the learning process and highlights the students' independence following inquiry sessions (Sokołowska in the study (15)). The GIL enables students to explore concepts by following a sequence of scientific steps, covering identifying problems, forming hypotheses, doing experiments, discussing findings, drawing conclusions, and engaging in peer communication. This appears to be a crucial method for teaching students from diverse academic backgrounds in the classroom (16). This method enables students to guide the exploration process, with the teacher's duty primarily being to pose questions. Although the teacher may have their own ideas about the discussion's outcomes, students retain the chance to draw conclusions from their own scientific knowledge (17).

According to Sanjaya in the study (18), in inquiry learning, students learn better when they are active, but their activities require guidance. In addition, Suparno in the study (19) claims that the guided inquiry learning benefits teachers by enabling them to direct students through activities with the help of initial questions and leading discussions. In this model, teachers play an active role in identifying problems and determining the steps needed to solve them (20). Using the inquiry model in teaching helps students focus on guidance and instructions from the teacher, which aids in their understanding of lesson concepts. This approach ensures that students are not confused and are less likely to fail, as the teacher is actively involved throughout the process.

Meanwhile, Islamic Religious Education subjects in schools are taught conventionally, namely lectures like a cleric in carrying out religious studies. Students only listen and tend to be passive and boring. Therefore, the application of guided inquiry learning models in Islamic Religious Education is considered more effective and can help students to become more active, creative, and innovative, especially in thinking and reasoning activities. In addition, students will not get bored because they play a more active role in learning with teacher guidance.

The main principles in Islamic religious education include monotheism, noble morals, knowledge and social life that teaches the values of brotherhood, mutual assistance, and concern for society. In the era of globalization, Islamic education is faced with a number of

challenges. One of them is integrating Islamic values with universal values such as human rights, pluralism, and democracy. For that reason, it is not enough to provide learning only with dogmatic lectures, but it is important to apply a guided inquiry learning model so that students are active in searching and finding, thinking critically and logically with teacher guidance so that the abilities possessed by students can develop and have a good mentality.

Several prior studies have highlighted improvements in student performance through the use of the guided inquiry learning. For example, (21) found that implementing this model enhanced students' science process skills (SPS) and cognitive achievements, and positively impacted the relationship between the two. In addition, (22) stated that the guided inquiry learning impacted the comprehension and discovery of notions among tenth-grade multimedia students of vocational school. (23) also mentioned that using the guided inquiry model with third-grade students of elementary school can enhance both the learning process and students' achievements. The same thing was also expressed by (24), who stated that implementing guided inquiry learning for second-grade elementary students can enhance their learning outcomes, including both group performance and written test results.

In addition, there are several studies that reveal the effectiveness of using the inquiry learning method in Islamic religious subjects. In the study of (25) shows that the application of the inquiry learning method in Islamic Religious Education subjects has an influence on students' learning activities, namely encouraging students to play an active role in discovering knowledge themselves, having real and active learning experiences. Students are also trained in how to solve problems and make decisions in solving these problems. In addition, students are also required to be fully responsible for their learning process. Teachers must adjust to the activities carried out by students so as not to interfere with the learning process. So in using the inquiry method also provides opportunities for students to get real learning experiences because students are required to be active in discovering knowledge themselves as a result of solving problems that have been found. In the study of (26) shows that the learning model using the inquiry method can make students more active, innovative, independent, critical and confident to be themselves. Students generally become more confident in solving existing problems. So the use of the inquiry method clearly makes students confident, active, creative, critical and independent in solving the problems faced. Although research on the use of the inquiry method in Islamic religious education subjects has been widely conducted and studied as mentioned above, there are still few that touch on the aspect of guided inquiry learning. The guided inquiry method is able to provide opportunities for students to develop skills in reasoning and get used to facing problems that must be solved. In this process there must be guidance and direction from a teacher so that this inquiry method does not provide opportunities for students to be free to think or reason.

In reality, there are still many teachers who have not found suitable learning methods or media due to limited facilities in schools, which leads to issues like low student learning outcomes. According to observations conducted at SMAN 10 Malang, it appears that students are still generally passive during the learning process. Students also struggle to comprehend the material presented in Islamic religious education lessons. This is evident from some students who engage in play during learning activities. Furthermore, student

test scores remain under the cut score (KKM). The cut score set is 60, where students are declared to have completed their studies if they can achieve a score of 60 or more.

Building on prior research and findings from the preliminary study, it is considered essential to conduct research on implementing the guided inquiry learning in the tenth-grade Islamic religious education at SMAN 10 Malang. The purpose of this study was to determine the effect of implementing a guided inquiry learning model on student learning achievement in Islamic religious education subjects for class X at SMAN 10 Malang..

Material and Methods

This research was conducted at SMAN 10 Malang with a focus on class X students who are studying Islamic Religious Education. The sampling technique used in this study was using a saturated sampling technique, because all populations were used as samples, namely 36 class X A students as the experimental group and 35 class X B students as the control class. The experimental class was given model learning. Overall, this study involved 71 students as participants.

This quantitative study employed a quasi-experimental design, specifically a non-equivalent control group design. The sample from this research consisted of 2 classes; class XA applied the guided inquiry learning and class XB used the conventional method. The research design is presented in Table 1.

Table 1. Pretest-Posttest Control Group Design

R1	O1	X	O2
R2	O3	-	O4

Information:

R1 : experimental class

R2 : control class

O1 : pretest (experimental class)

O3 : pretest (control class)

O2 : posttest (experimental class)

O4 : posttest (control class)

X : learning using the guided inquiry model

- : learning using the conventional method

In this study, the focus of the problems studied in learning achievement in the cognitive domain of the aspects of remembering (meaningful learning, problem solving) and understanding (classification, comparing). The data collection of this study used tools in the cognitive domain through objective tests consisting of 25 questions with 4 answer choices with the consideration that multiple-choice test questions can be used to measure more complex learning outcomes and are related to aspects of memory, understanding, application, analysis, synthesis, and evaluation. The data, consisting of students' pretest and posttest scores, were assessed by figuring out the mean, standard deviation, conducting normality and homogeneity tests, and performing hypothesis testing. The prerequisite tests carried out were normality tests using the Kolmogorov-Smirnov and Shapiro Wilk formulas and homogeneity tests using the Levene test, while hypotheses were tested and analyzed using the paired sample t test to find out whether there were significant differences between the subjects' pretest and posttest scores. All parametric tests carried out in this study have a significance value of 5%.

Results and Discussion

The research findings were derived from the test scores from the experimental and control groups at SMAN 10 Malang. A 25-question multiple-choice test was used to collect the data.

Calculating the mean and standard deviation: The calculation results provide the mean, standard deviation, and variance for both classes, as presented in Table 2 below.

Table 2. Summary of Calculation Results of Mean and Standard Deviation

Information	Experimental Class		Control Class	
	Pretest	Posttest	Pretest	Posttest
Mean	38,67	75,67	34,50	58,33
Standard Deviation	9,371	12,369	8,025	13,476
Variance	87,816	152,989	64,397	181,609

As Table 2 shows, the mean score for the experimental class in the posttest exceeds that of the control class. Additionally, the standard deviation for both pretest and posttest scores in each class is smaller than the mean, indicating no data deviation. The pretest scores of the control and experimental classes looked almost the same, namely the average pretest score of the experimental class was 38.67 and the average pretest score of the control class was 34.50. Although the experimental class score was higher than the control class, it can still be said that the control and experimental classes came from the same or homogeneous conditions. After learning and different treatments were given to the control and experimental classes, there was a significant difference. The average posttest learning achievement of the experimental class was 75.67 and for the control class it had an average of 58.33. These results indicate that the learning achievement of Islamic religious education in the experimental class was much better after being given the guided inquiry learning model treatment than the control class.

Normality Test: In this study, the normality test was conducted using the Kolmogorov-Smirnov test, facilitated by the SPSS V 24 program. The outcomes of the normality test are as follows:

Table 3. Normality Test Outcomes

Class	Test of Normality					
	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	sig	Statistic	df	sig
Pretest Experimental Class	,157	35	,059	,950	35	,165
Posttest Experimental Class	,141	35	,130	,937	35	,078
Pretest Control Class	,146	34	,103	,932	34	,065
Posttest Control Class	,148	34	,092	,935	34	,067

The information depicted in table 3 shows that the sig value for the posttest of the experimental group is 0.078 and the Sig value for the posttest of the control group is 0.067. Because the Sig value for both groups is > 0.05 , then as the basis for decision making in the Shapiro Wilk normality test, it can be concluded that the pretest data of student learning outcomes for the experimental group and the control group are normally distributed.

Homogeneity Test:

In this study, to find out whether the data was homogeneous, calculations were carried out using SPSS V 24, and the results were obtained as follows:

Table 4. Homogeneity Test Results

Test of Homogeneity of Variance				
	Levene Statistic	df1	df2	Sig.
Based on Mean	,890	1	69	,349
Based on Median	,562	1	69	,447
Based on Median and with adjusted df	,564	1	56,472	,477
Based on trimmed mean	,869	1	69	,366

Based on table 4, it is known that the sig value Based on Mean for the learning outcome variable is 0.349, because the Sig value of 0.349 > 0.05, it can be concluded that the variance of the pretest learning outcome data in the experimental group and the control group is homogeneous.

Hypothesis Testing:

The examination of pretest and posttest scores shows that the data meets the requirements to be analyzed using the t test, with the hypothesis testing presented in Table 5 below.

Table 5. Hypothesis Test Results One Party t-test

Independent Samples Test					
Levene's Test for Equality of Variances					
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	,890	,349	2,196	69	,032
Equal variances not assumed			2,196	57,57	,032

The hypothesis test outcomes, as presented in Table 5 above, show the significance value of less than α ($0.032 < 0.05$). Therefore, H_a is accepted, indicating that guided inquiry learning has a considerable influence on tenth-grade students' accomplishment in Islamic religious education at SMAN 10 Malang. The formula for calculating student improvement is as follows:

$$LO = \frac{[X \text{ Exp Posttest} - X \text{ Control Posttest}]}{X \text{ Kontrol posttest}} \times 100\%$$

$$LO = \frac{[75,67 - 58,33]}{58,33} \times 100\%$$

$$= 29,72\%$$

The result is that through the application of the guided inquiry learning model, the learning achievement of class X students in the subject of Islamic Religious Education at SMAN 10 Malang has increased by 29.72%.

Simple Regression Test : The regression test aims to obtain a functional relationship between two or more variables which have an influence between the dependent and independent variables. The regression test was conducted using the SPSS V 24 software. The test outcomes are presented in Table 6 below:

Table 6. Simple Regression Test Results

Coefficients ^a					
Unstandardized Coefficients			Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	22,484	4,428		5,191	,000
Regression	,656	,067	,875	10,171	,000

As displayed in Table 6 and referring to observations, student achievement in Islamic religious education has clearly improved. Students in the experimental class outperformed the control group in terms of mean score. The hypothesis testing was deemed acceptable (H_a), with the significance value being less than α ($0.032 < 0.05$). The data analysis indicates that using the guided inquiry learning significantly impacts the achievement of tenth-grade students at SMAN 10 Malang, with an improvement in student learning outcomes by 29.72%. Based on this, it can be concluded that the guided inquiry learning model developed in this study is feasible, practical, and effective to improve students' mastery of concepts and problem-solving abilities in Islamic religious education materials.

Discussion

Within the design of this study, the researcher employed two different groups and provided different treatments. Different treatment in this context refers to employing distinct learning models in the two research groups: the experimental class utilized the guided inquiry learning model, while the control class used the conventional learning model.

How Guided Inquiry and Conventional Learning Affect Student Achievement Differently:

According to the research findings, the average posttest score for the experimental class was 65.67, compared to 58.33 for the control class. This resulted in a 12.58% improvement in student achievement. This proves that the guided inquiry learning is quite effective in enhancing the students' Islamic religious education learning outcomes at SMAN 10 Malang. This model necessitates that students actively engage in their own learning by participating in various activities such as asking questions, seeking information sources, and conducting investigations. This finding is similar to the study by (27), which found that students in the experimental (inquiry) class performed better than those in the control class. The improved performance is attributed to the fact that inquiry-based learning enables students to more effectively tackle problems posed by the teacher. Furthermore, (28) found that students who received instruction using guided inquiry learning based on local culture performed better than those who were instructed using direct learning. Students and teachers gave very positive responses to the model that incorporates local culture. Likewise, (29) and (30) state that through inquiry learning, students will acquire diverse experiences that enhance their abilities. Those who are engaged in the instructional process will experience a sense of autonomy as they engage in discussions and solve problems on their own.

The Effect of Guided Inquiry Learning Compared to Conventional Method on Student Achievement:

Based on the results of hypothesis testing, it shows a significance value of 0.032, which is smaller than 0.05. This indicates that the application of guided inquiry learning has a significant impact on student performance in Islamic religious education. This aligns with the study conducted by (31), which states that using the inquiry model enhances students' learning achievements. Additionally, (32) found that the use of guided inquiry has an impact on learning outcomes when compared to conventional learning. The effect is evident from the improvement of student learning outcomes and the classroom atmosphere where children are more active and make learning fun. Likewise, (30-32), found that the implementation of guided inquiry learning had a beneficial impact on students' science achievement. This is evidenced by the higher science test results of students who utilized the guided inquiry learning compared to those who did not use it. The findings of this study are corroborated by (33, 34) whose studies also demonstrated a significant impact of the guided inquiry learning on both the learning outcomes and activities of secondary school students.

Conclusions

Based on the research results and analysis of the data obtained, it can be concluded that the application of the guided inquiry learning model is quite effective in improving student learning outcomes and the application of the guided inquiry learning model has a significant effect on the Islamic Religious Education learning outcomes of grade tenth at SMAN 10 Malang Regency. In the future, other researchers need more literature on the development of guided inquiry in science learning, especially an emphasis on the role of guided inquiry as a unit, one of the abilities that researchers want to instill in students because by focusing on research you can get more perfect results. Time constraints and lack of student experience in implementing the syntax of the guided inquiry learning model caused researchers to be unable to implement the syntax of the guided inquiry learning model ideally. Increasing mastery of concepts and thinking skills is not formed in a short time but requires a process. For further researchers, thorough preparation and time management are needed before implementing learning with the application of the guided inquiry learning model so that it runs smoothly and pleasantly.

Submission Title: Application of the Guided Inquiry Learning Model and Conventional on Students' Islamic Religious Education Learning Outcomes

Dear Suyitno,

We appreciate your submission to the "International Research Journal of Multidisciplinary Scope" with the online ISSN of 2582-631X. Your manuscript has been reviewed, and **Minor revisions** are necessary (see attached/below for comments). It is advised that you thoroughly review the manuscript and note any modifications that were made.

Your amended work must be returned in accordance with our publication policy no later than **7 days** after you get this email.

Please make sure to include any suggested changes in your updated manuscript before submitting it for further review. Additionally, for easier reference, highlight or annotate the manuscript's modifications.

The format for the response letter must be as follows:

Referee 1, issue 1: Response 1:

Referee 2, issue 2: Response 2:

Editor, issue 1: Response 1:

The final decision will be taken after the nature of your response letter and revision.

English native writers should make sure their work has been thoroughly reviewed for language, grammar, and style (if needed). You should do this since it will significantly shorten the time it takes for your article to be published.

***References:** References must be included exactly in the manner required by the publication. Please check the author guidelines.

Note: Please make sure to submit your revised manuscript in this trail email and please submit the following documents and notify the same via e-mail.

1. Corrected Manuscript. Please check the both suggestive corrections by reviewers Mentioned in the main manuscript (if applicable).

Editor comments: Attached (if applicable).

Reviewer 1 & 2 comments: Attached

NB:

1. Please do the modifications in different colors in the manuscript and reply with a response separately and revert us to this email only within the timeline mentioned in this email to avoid delay in publication.

2. NOT following the journal guideline may cause immediate REJECTION of the manuscript.

3. Missing reply / Not carrying out the revision(s) as reviewers suggested may cause immediate REJECTION of the manuscript.

Please feel free to contact us on editor@irjms.com, for any queries in this regard.

Sincerely,

Editor

Dear Author,

Thank you for sharing your revised manuscript. After careful revision there are few minor corrections that need to be done.

Please provide your point-by-point response to the below comments within 1-3 days. Repeated mistakes lead towards rejection/ extreme delay in publication.

Comments

1. Avoid to use the citation as the subject of the sentence; make the sentence in other words with the same meaning, but citation in the bracket at the end of the sentence. Please recheck the whole manuscript and correct all this kind of errors.

encountered will affect students' mastery and learning outcomes (6).

According to (7), the learning approach can be understood as our perspective or starting point in the learning process. It reflects a broad, general view of how the process occurs, serving to accommodate, inspire, reinforce, and underpin specific learning methods within a particular theoretical framework. In the study Roy Killen (8) states that there are two methods of learning: one that focuses on the teacher (teacher-centered) and another that centers on the student (student-centered). The former minimizes the use of direct learning strategies, deductive methods, or expository techniques (9), while the latter

maximizes the use of discovery, inquiry, and inductive learning strategies. Implementing the inquiry method is the right way for students.

According to (10), guided inquiry is a teaching approach aimed at helping students understand concepts and the connections between them. In this method, the teacher presents examples, assists students in identifying patterns within these examples, and concludes the lesson once the students can articulate the concepts taught. In addition, (11) stated that the guided inquiry learning is a form of inquiry-based instructions where the teacher guides students, helping them explore and analyze critical and scientifically argumentative topics through specific steps. These steps include orientation, formulating a problem, developing a hypothesis, and drawing conclusions (12). According to

and have a good mentality.

Several prior studies have highlighted improvements in student performance through the use of the guided inquiry learning. For example (21) found that implementing this model enhanced students' science process skills (SPS) and cognitive achievements, and positively impacted the relationship between the two. In addition, (22) stated that the guided inquiry learning impacted the comprehension and discovery of notions among tenth-grade multimedia students of vocational school. (23) also mentioned that using the guided inquiry model with third-grade students of elementary school can enhance both the learning process and students' achievements. The same thing was also expressed by (24) who stated that implementing guided inquiry learning for second-grade elementary students can enhance their learning outcomes, including both group performance and written test results.

In addition, there are several studies that reveal the effectiveness of using the inquiry learning method in Islamic religious subjects. In the study of (25) shows that the application of the inquiry learning method in Islamic Religious Education subjects has an influence on students' learning activities, namely encouraging students to play an active role in discovering knowledge themselves, having real and active learning experiences.

2. The plagiarism of the manuscript is 29%; please reduce it below 20%.

Requesting you to maintain this same trail mail ONLY while replying.

Comments: Manuscript IRJMS 02275

Final Comments: *Minor correction*

The study is well written, however, there are a few areas that require further clarification and improvement before the paper can be accepted for publication.

Mandatory corrections in different colors to identify clearly with responses in separate pages and in the manuscript itself to avoid delay in publication.

Reviewer 1:

1. The introduction outlines the study's purpose but lacks a robust justification of why the Guided Inquiry Learning Model is particularly relevant to Islamic Religious Education.
2. The literature review is comprehensive but could benefit from a more critical discussion of prior studies.
3. While the study design is described, more details are needed regarding the sampling process. How were participants selected, and what measures were taken to ensure the sample represents the target population?
4. The statistical methods used are appropriate; however, the rationale for choosing specific tests should be explained in greater detail.
5. The results are presented clearly but need deeper analysis.

Reviewer 2:

1. The research objectives are stated but could be more concise and aligned with the hypotheses.
2. The study mentions the theoretical basis of the Guided Inquiry Learning Model but does not sufficiently connect it to Islamic pedagogy principles.
3. The study demonstrates promising results for the Guided Inquiry model but falls short of discussing its practical feasibility.
4. The conclusion summarizes the findings but should also address limitations and suggest areas for future research.

5. While the study mentions ethical approval, there is no discussion of how cultural sensitivities were addressed in the research process.

Editor’s Comment:

guided inquiry learning model has a significant effect on student learning outcomes in Islamic Religious Education subjects.

Dear Suyitno,

The Galley Proof (GP) of your manuscript is in the attached file.

To ensure accuracy of information in your manuscript, please check the PDF copy of the galley proof and **please provide a list of correction(s) in separate word file mentioning the page and line number (if any)** that will help us to prepare the final copy of your manuscript for uploading onto the IRJMS website soon. Please revert to this email **ONLY** without changing the subject line.

The galley proof has been prepared directly from the final manuscript shared by you. However, in the galley proof preparation process, certain errors may have occurred due to a difference in the softwares used for which the IRJMS/Iquz Galaxy Publisher is not liable. As per the IRJMS journal policy, every reference must be precise and comprehensive.

Furthermore, as a part of the copyediting process there might be minor changes made in the Galley Proof. You are therefore requested to read the galley proof thoroughly and send approval for all the corrections made in order to ensure that the original meaning of the content has not been altered in case of significant changes in the text.

Guided Inquiry vs. Conventional Methods: Shaping Learning Outcomes in Islamic Religious Education

Suyitno Suyitno^{1*}, Dalhari², Supriyono³, Chusnul Chotimah⁴

^{1,3}Balitar Islamic University, Indonesia, ²Diponegoro Islamic Collage of Tulungagung, Indonesia, ⁴Universitas Islam Negeri Sayyid Ali Rahmatullah Tulungagung, Indonesia. *Corresponding Author's Email: drsuyitno03@gmail.com

Abstract

This study investigates the effectiveness of the guided inquiry learning (GIL) model in enhancing learning outcomes and its impact on student performance in Islamic religious education. While previous research has explored the application of the GIL model across various subjects, most have focused on specific competency areas rather than assessing its effectiveness. Adopting a quasi-experimental design, this study targeted tenth-grade students during the 2023/2024 academic year, with a sample of 71 students selected through multi-stage sampling. Data collection involved student test scores, which were analyzed using one-way ANOVA. The results indicate that the GIL model is effective in improving learning outcomes and shows a significant influence on student performance in Islamic Religious Education.

Keywords: Conventional Learning, Guided Inquiry Learning, Islamic Religious Education, Learning Outcomes.

Introduction

Learning competency is a multifaceted capability that students possess, encompassing the mastery of understanding, capabilities, attitudes, and values, which are apparent in their thoughts and actions, as described by Hartig and Leutner in their work (1). One form of managing student diversity is by applying learning strategies that accommodate the learning needs of each student (2). In addition, learning using the current curriculum provides freedom for educators to design learning to suit students' learning needs (3). This is of course beneficial for students because differences in learning processes, intelligence and interests are not a problem for students but are unique things that can be used to complement each other (4). Therefore, educators are required to understand the learning approach that will be used, choose appropriate learning strategies, learning methods and techniques that are appropriate to the topic and discussion (5). This situation naturally influences its use in the pedagogical process, where the circumstances and conditions encountered will affect students' mastery and learning outcomes (6). The learning approach can be understood as our perspective or starting point in the learning process. It reflects a broad, general view of how the process occurs,74

servng to accommodate, inspire, reinforce, and underpin specific learning methods within a particular theoretical framework (7). In his article, Roy Killen states that there are two methods of learning: one that focuses on the teacher (teacher-centered) and another that centers on the student (student-centered) (8). The former minimizes the use of direct learning strategies, deductive methods, or expository techniques (9), while the latter maximizes the use of discovery, inquiry, and inductive learning strategies. Implementing the inquiry method is the right way for students. Guided inquiry is a teaching approach aimed at helping students understands concepts and the connections between them. In this method, the teacher presents examples, assists students in identifying patterns within these examples, and concludes the lesson once the students can articulate the concepts taught (10). The guided inquiry learning is a form of inquiry-based instructions where the teacher guides students, helping them explore and analyze critical and scientifically argumentative topics through specific steps (11). These steps include orientation, formulating a problem, developing a hypothesis, and drawing conclusions (12). Directed inquiry, as described by kindsvatter

This is an Open Access article distributed under the terms of the Creative Commons Attribution CC BY license (<http://creativecommons.org/licenses/by/4.0/>), which permits unrestricted reuse, distribution, and reproduction in any medium, provided the original work is properly cited.

(Received 2nd September 2024; Accepted 17th January 2025; Published XXXX 202X)

80 in his work, refers to a type of inquiry where the teacher
 81 plays a significant role. Various models of Inquiry-Based Science Education (IBSE) have been
 82 created that focus on enhancing student engagement; one of which is the guided inquiry learning (GIL) (13). The model encompasses
 83 critical thinking and reasoning, skill enhancement, scientific methods, and teamwork and
 84 collaboration. In the GIL, students work together and participate actively in discussions to identify
 85 the best solutions to the problems presented by their teacher (14). The design showcases a
 86 scientific checklist that cycles through various stages in the learning process and highlights the
 87 students' independence following inquiry sessions, as described by Sokołowska in his study
 88 (15). The GIL enables students to explore concepts by following a sequence of scientific steps
 89 covering identifying problems, forming hypotheses, doing experiments, discussing findings,
 90 drawing conclusions, and engaging in peer communication. This appears to be a crucial
 91 method for teaching students from diverse academic backgrounds in the classroom (16). This
 92 method enables students to guide the exploration process, with the teacher's duty primarily being to
 93 pose questions. Although the teacher may have their own ideas about the discussion's outcomes,
 94 students retain the chance to draw conclusions from their own scientific knowledge (17). In
 95 inquiry learning, as Sanjaya explains, students learn better when they are active, but their
 96 activities require guidance (18). Additionally, in his work, Suparno claims that the guided
 97 inquiry learning benefits teachers by enabling them to direct students through activities with the
 98 help of initial questions and leading discussions (19). In this model, teachers play an active
 99 role in identifying problems and determining the steps needed to solve them (20). Using the
 100 inquiry model in teaching helps students focus on guidance and instructions from the teacher,
 101 which aids in their understanding of lesson concepts. This approach ensures that students are
 102 not confused and are less likely to fail, as the teacher is actively involved throughout the
 103 process. Meanwhile, Islamic Religious Education subjects in schools are taught conventionally
 104 namely lectures like a cleric carrying out religious studies. Students only listen and tend to
 105 be passive and boring. Thus, implementing guided inquiry learning models

Islamic Religious Education is seen as a more effective approach, encouraging students to
 actively engage, think creatively, and develop innovative ideas, particularly in activities that
 involve reasoning and critical thinking. In addition, students will not get bored because they
 play a more active role in learning with teacher guidance. The main principles in Islamic
 Religious Education include monotheism, noble morals, knowledge and social life that teaches
 the values of brotherhood, mutual assistance, and concern for society. In the era of
 globalization, Islamic education is faced with a number of challenges. One of them is
 integrating Islamic values with universal values such as human rights, pluralism, and
 democracy. For this reason, simply delivering dogmatic lectures is not sufficient. It is
 essential to implement a guided inquiry learning model that encourages students to
 actively explore and discover, and think critically and logically, under the teacher's
 guidance. As a result, students can develop their skills and mentality. Several prior
 studies have highlighted improvements in student performance through the use of the
 guided inquiry learning. For example, implementing this model enhanced students' science
 process skills (SPS) and cognitive achievements, and positively impacted the relationship
 between the two (21). In addition, guided inquiry learning impacted the comprehension
 and discovery of notions among tenth-grade multimedia students of vocational school
 (22). Using the guided inquiry model with third-grade students of elementary school can
 also enhance both the learning process and students' achievements (23). The same
 result was expressed in a study involving second-grade elementary students, showing
 that implementing guided inquiry learning enhanced their learning outcomes,
 including both group performance and written test results (24). Several studies also
 highlight the effectiveness of the inquiry learning method in Islamic Religious
 Education. First, implementing the inquiry learning method positively impacts
 students' learning activities by encouraging them to actively engage in discovering
 knowledge on their own. It provides students with meaningful, hands-on learning
 experiences (25). Additionally, students are trained to solve problems and make
 decisions as they work through challenges. They are also held accountable for their
 own learning process. Teachers, in turn,

182 must adapt to the activities of the students, 15
 183 ensuring that their involvement enhances rather 16
 184 than disrupts the learning process. Overall, the 17
 185 inquiry method offers students valuable real-life 18
 186 learning experiences by requiring them to take an 19
 187 active role in knowledge discovery through 20
 188 problem-solving. Second, using the inquiry method 21
 189 helps students become more active, innovative, 22
 190 independent, critical, and confident in expressing 23
 191 themselves. Students, in general, gain more self- 24
 192 assurance when solving problems (26). Clearly, the 25
 193 inquiry method fosters confidence, activeness, 26
 194 creativity, critical thinking, and independence in 27
 195 addressing challenges. Although the inquiry 28
 196 method has been widely explored in the context of 29
 197 Islamic Religious Education, as mentioned earlier, 30
 198 few studies have focused specifically on guided 31
 199 inquiry learning. The guided inquiry approach 32
 200 offers students the opportunity to enhance their 33
 201 reasoning skills and become accustomed to 34
 202 tackling problems. This process requires guidance 35
 203 and direction from teachers to ensure that the 36
 204 inquiry method does not allow students to think of 37
 205 reason without appropriate support. In reality, 38
 206 there are still many teachers who have not found 39
 207 suitable learning methods or media due to limited 40
 208 facilities in schools, which leads to issues like low 41
 209 student learning outcomes. According to 42
 210 observations conducted at SMAN 10 Malang, it 43
 211 appears that students are still generally passive 44
 212 during the learning process. Students also struggle 45
 213 to comprehend the material presented in Islamic 46
 214 Religious Education lessons. This is evident from 47

some students who engage in play during learning activities. Furthermore, student test scores remain under the cut score (KKM). The cut score set is 60, where students are declared to have completed their studies if they can achieve a score of 60 or more. Building on prior research and findings from the preliminary study, it is considered essential to conduct the study in the tenth-grade Islamic Religious Education at SMAN 10 Malang. This study aims to assess the impact of implementing the guided inquiry learning model on student academic performance in Islamic Religious Education.

Methodology

This study was carried out at SMAN 10 Malang, focusing on tenth-grade students studying Islamic Religious Education. The sampling method employed was saturated sampling, as the entire population was included in the sample. Specifically, 36 students from class X A were designated as the experimental group, while 35 students from class X B served as the control group. The experimental group received instruction using the guided inquiry learning. In total, 71 students participated in this research. This quasi-experimental study utilized a non-equivalent control group design. The sample comprised two classes: class XA, which implemented the guided inquiry learning, and class XB, which followed the conventional method. The research design is outlined in Table 1.

measure more complex learning outcomes and are related to aspects of memory, understanding, application, analysis, synthesis, and evaluation. The data, consisting of students' pretest and posttest scores, were assessed by figuring out the mean, standard deviation, conducting normality and homogeneity tests, and performing hypothesis testing. The prerequisite tests included a normality check using the Kolmogorov-Smirnov and Shapiro-Wilk formulas, along with a homogeneity test conducted using the Levene test. To examine whether there were significant differences between the pretest and posttest scores of the participants, the data were analyzed using the

278 paired sample t-test. All parametric tests carried out
279 in this study have a significance value of 5%.
280

281 Results and Discussion 288

282 The research findings were derived from the test
283 scores from the experimental and control groups
284 at SMAN 10 Malang. A 25-question multiple-choice
285 test was used to collect the data.

Calculating the Mean and Standard Deviation

The calculation results provide the mean, standard deviation, and variance for both classes, as presented in Table 2 below.

291
292 **Table 2:** Results of Mean and Standard Deviation

Information	Experimental Class		Control Class	
	Pretest	Posttest	Pretest	Posttest
Mean	38,67	75,67	34,50	58,33
Standard Deviation	9,371	12,369	8,025	13,476
Variance	87,816	152,989	64,397	181,609

293
294 As Table 2 shows, the mean score for the
295 experimental class in the posttest exceeds that of
296 the control class. Additionally, the standard
297 deviation for both pretest and posttest scores in
298 each class is smaller than the mean, indicating
299 data deviation. The pretest scores for both groups
300 were nearly identical, with the experimental class
301 averaging 38.67 and the control class 34.50.
302 Despite the experimental class scoring slightly
303 higher, it can be concluded that both classes were
304 initially homogeneous. However, after
305 implementing different treatments during the
306 learning process, the results showed a major

improvement. The experimental class achieved an average posttest score of 75.67, compared to 58.33 in the control class. These findings highlight that the learning outcomes in Islamic Religious Education for the experimental class improved significantly following the application of the guided inquiry learning.

Normality Test

In this study, the Kolmogorov-Smirnov test was used to check for data normality, with the assistance of the SPSS version 24 software. The outcomes of the normality test are as follows.

319
320 **Table 3:** Normality Test

Class	Test of Normality					
	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	Sig	Statistic	df	Sig
Pretest (Experimental)	,157	35	,059	,950	35	,165
Posttest (Experimental)	,141	35	,130	,937	35	,078
Pretest (Control)	,146	34	,103	,932	34	,065
Posttest (Control)	,148	34	,092	,935	34	,067

321
322 The data presented in Table 3 reveals that the
323 significance value for the experimental group's
324 posttest is 0.078, while the control group's posttest
325 has a significance value of 0.067. Since both values
326 are greater than 0.05, based on the decision
327 making criteria for the Shapiro-Wilk normality
328 test, it can be concluded that the pretest data for
329 student learning outcomes in both the

experimental and control groups follow a normal distribution.

Homogeneity Test

In this study, to find out whether the data was homogeneous, calculations were carried out using SPSS V 24, and the results were obtained as follows.

337
338 **Table 4:** Homogeneity Test Results

	Test of Homogeneity of Variance			
	Levene Statistic	df1	df2	Sig.
Based on Mean	,890	1	69	,349
Based on Median	,562	1	69	,447

Based on Median and with adjusted df	,564	1	56,472	,477
Based on trimmed mean	,869	1	69	,366

339
340

341 Referring to Table 4, the significance value (Sig) 47
342 based on the mean for the learning outcome 3 48
343 variable is 0.349. Since the Sig value of 0.349 is 49
344 greater than 0.05, it can be concluded that the 50
345 variance in the pretest learning outcome data 51
346 between the experimental group and the control 52

353
354**Table 5:** Hypothesis Test Results One Party t-test

Independent Sample Test					
Levene's Test for Equality of Variances					
	F	Sig.	t	df	Sig.(2-tailed)
Equal variances assumed	,890	,349	2,196	69	,032
Equal variances not assumed			2,196	57,57	,032

355

356 The results of the hypothesis test, as shown in 360
357 Table 5, reveal a significance value below α (0.032 361
358 < 0.05). This confirms that H_a is accepted 362
359 demonstrating that the guided inquiry learning 363

364

365

$$LO = \frac{[X \text{ Exp Posttest} - X \text{ Control Posttest}]}{X \text{ control posttest}} \times 100\%$$

366

$$LO = \frac{[75,67 - 58,33]}{58,33} \times 100\%$$

367

368 Based on the calculation above, the application of 373
369 the guided inquiry learning has led to a 29.72% 374
370 improvement in the learning achievement of the 375
371 students. 376

372

Simple Regression Test

379

380

Table 6: Simple Regression Test Results

	Unstandardized Coefficients		Co efficient ^a		
	B	Std. Error	Standardized Coefficients	t	Sig.
(Constant)	22,484	4,428		5,191	,000
Regression	,656	,067	,875	10,171	,000

381

382 As shown in Table 6 and supported by 93
383 observations, student performance in Islamic 94
384 Religious Education has clearly improved. The 95
385 experimental group exceeded the control group in 96
386 terms of average scores. The hypothesis test (H_a) 97
387 was accepted, as the significance value was below 98
388 the α level (0.032 < 0.05). The data analysis reveals 99

389

390 that the guided inquiry learning model has 400
391 significant positive effect on the achievement of 401
392 tenth-grade students at SMAN 10 Malang 402
enhancing their learning outcomes by 29.72%. 403

group is consistent, indicating homogeneity.

Hypothesis Testing

The analysis of pretest and posttest scores reveals that the data satisfies the criteria for conducting a t-test. The results of the hypothesis testing are detailed in Table 5 below.

significantly impacts the academic achievement of tenth-grade students in Islamic Religious Education at SMAN 10 Malang. The formula used to measure student improvement is as follows:

The regression test is conducted to identify the relationship between two or more variables, focusing on how the independent variables influence the dependent variable. The regression test was conducted using the SPSS V 24 software. The test outcomes are presented in Table 6 below:

Therefore, it can be concluded that the guided inquiry learning model developed in this study is not only feasible and practical but also effective in improving students' understanding of concepts and their problem-solving skills in Islamic Religious Education.

Discussion

Within the design of this study, the researcher employed two different groups and provided different treatments. Different treatment in this

404 context refers to employing distinct learning
405 models in the two research groups: the
406 experimental class utilized the guided inquiry
407 learning model, while the control class used the
408 conventional learning model. 458

409 **How Guided Inquiry and Conventional** 410 **Learning Affect Student Achievement** 411 **Differently** 459 412 460

413 According to the research findings, the average
414 posttest score for the experimental class was
415 65.67, compared to 58.33 for the control class. This
416 resulted in a 12.58% improvement in student
417 achievement. This proves that the guided inquiry
418 learning is quite effective in enhancing the
419 students' Islamic religious education learning
420 outcomes at SMAN 10 Malang. This model
421 necessitates that students actively engage in their
422 own learning by participating in various activities
423 such as asking questions, seeking information
424 sources, and conducting investigations. This
425 finding aligns with the results of a study, which
426 reported that students in the experimental
427 (inquiry) class outperformed those in the control
428 group. The enhanced performance is attributed to
429 the fact that inquiry-based learning helps students
430 address teacher-presented problems more
431 effectively (27). Additionally, another study found
432 that students who were taught using guided
433 inquiry learning, grounded in local culture,
434 performed better than those who received
435 traditional direct instruction. Students and
436 teachers gave very positive responses to the model
437 that incorporates local culture (28). Through
438 inquiry learning, students will acquire diverse
439 experiences that enhance their abilities. Those
440 who are engaged in the instructional process will
441 experience a sense of autonomy as they engage in
442 discussions and solve their problems (29, 30). 493

443 **The Effect of Guided Inquiry Learning** 444 **Compared to Conventional Method on** 445 **Student Achievement** 494 446 495 447 496 448 497

449 The hypothesis testing results reveal a significance
450 value of 0.032, which is below 0.05, suggesting that
451 the implementation of guided inquiry learning has
452 a meaningful impact on student performance in
453 Islamic Religious Education. This is consistent with
454 previous research, which found that using the
455 inquiry model improves students' academic
456 achievements (31). Another study highlighted that
457 guided inquiry positively affects learning
458 outcomes, with improvements visible not only in
459 academic performance but also in creating a more
460 engaging and active classroom environment (32).
461 Several other studies have also noted that guided
462 inquiry learning leads to better science
463 achievement, as shown by higher test scores
464 among students who used the model compared to
465 those who did not (30-32). The results of this study
466 support the findings of earlier research, which
467 similarly found that guided inquiry learning
468 significantly influenced both learning outcomes
469 and student engagement in secondary school
470 settings (33, 34).

461 **Conclusion**
462 From the analysis of research findings, it can be
463 concluded that guided inquiry learning is quite
464 effective in enhancing student learning outcomes,
465 specifically in the context of Islamic Religious
466 Education for tenth-grade students at SMAN 10
467 Malang. Future research should concentrate more
468 on the development of guided inquiry, particularly
469 focusing on its role as a comprehensive teaching
470 unit. However, due to time limitations and the
471 students' lack of experience with the guided
472 inquiry's syntax, the researchers were unable to
473 implement it ideally. It is important to remember
474 that increasing mastery of concepts and thinking
475 skills is not formed in a short time but requires a
476 process. For future studies, careful preparation
477 and effective time management before
478 implementing the guided inquiry model will be
479 essential for ensuring a smooth and engaging
480 learning experience.

481 **Conclusion**

482 From the analysis of research findings, it can be
483 concluded that guided inquiry learning is quite
484 effective in enhancing student learning outcomes,
485 specifically in the context of Islamic Religious
486 Education for tenth-grade students at SMAN 10
487 Malang. Future research should concentrate more
488 on the development of guided inquiry, particularly
489 focusing on its role as a comprehensive teaching
490 unit. However, due to time limitations and the
491 students' lack of experience with the guided
492 inquiry's syntax, the researchers were unable to
493 implement it ideally. It is important to remember
494 that increasing mastery of concepts and thinking
495 skills is not formed in a short time but requires a
496 process. For future studies, careful preparation
497 and effective time management before
498 implementing the guided inquiry model will be
499 essential for ensuring a smooth and engaging
500 learning experience.
